

EAV TESTING

Its principles,
EAV machines

Toxic burden testing – EAV machine

A modification of a Voll equipment
(constructed by doctor Reinhold Voll
more than 50 years ago.

Dr. Voll realized his testing on appr. 360 points
of the whole body, which was difficult both for the
therapist and for the client.

The equipment was simplified by a German physician
doctor Schimmel; it is this modification we use.

Principles of testing with our EAV machine

We test one point only.

**It is situated in the middle of the palm,
on the pericardium meridian.**

We test the skin resistance on this point:
Vegetative reflective test (VRT), or biofunctional diagnostic
(BFD) according to doctor Schimmel.

SALVIA and ACUCOMB

EAV machines delivered by Joalis

SALVIA
a standard EAV machine

ACUCOMB AC/V2 – „Better Future“,
model LIGHT
– a modern type of an EAV machine.
Simplified and more precise regulation.

Procedure

1. The client must take off all jewells (rings, watches, chains). His hand must be clean. If the hand sweats, wipe it dry. If it is too dry, rub some cream in the palm (very little will do – it must not be greasy!).
2. The client takes a seat opposite the therapist holding the ground electrode in one hand. The other hand lays on the table, palm upwards.

3. Choose the test point on the palm and push down the point of the probe to it. The probe makes an angle of appr. 45° with the palm (see the picture).
4. „Pump“ up and down with the probe on the test point, and regulate the position of the pointer with the knob, till the pointer on the machine rises up to „80“ on the scale. It is the basic setting. You can start testing.

NB!

The number of questions is limited.

**The test point on the palm
„wears away“ during the testing.**

**It is not possible
to carry out the testing for a longer time –
above all not in children!**

**If necessary, we can go on testing
on the other palm.**

EAV testing is a very precise and detailed method, esp. if applied by an experienced therapist.

- It reveals a problem at the very beginning.
- It can show a toxic burden that is hardly detectable with other methods.
- It is possible to localize the problem in the organ very precisely.
- It is possible to test what kind of problem is in the given tissue.
- It is possible to test what has caused the problem (emotions, environmental toxins).

The aim of our testing

To establish the core of the problem by means of several questions and to recommend suitable preparations.

- Detoxification is like a game of chess: there are some rules and it is necessary to think over every move.
- Each problem can have several ways of solutions; some of them are verified.
- Understanding the relations and causes of actions ongoing in the human body is crucial in this process.
